Art Unit: 2137

DETAILED ACTION

1. Claims 1-25 are pending.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

- 3. Claims 13-18 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
- 4. Claim 13 recites the limitation "said removable computer readable medium" in line 4. There is insufficient antecedent basis for this limitation in the claim. The word "removable" will be ignored for the purposes of applying prior art.
- 5. Any claim not specifically addressed is rejected by virtue of its dependencies.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 2137

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 1-7, 11-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sibert (U.S. 6,832,316), further in view of Tello (U.S. 6,463,537), and further in view of Langford (U.S. 6,507,911).

As per claim 1, Sibert discloses a method providing security for a plurality of data records stored on a computer-readable medium within a computing system, wherein said computer readable medium additionally stores a first data structure, starting at a first location within said computer readable medium, locating data records in said plurality thereof, said method a decryption subroutine executed as said computing system is being initialized, said decryption subroutine includes determining that electrical power has been turned on in said computing system, reading said encrypted version of said first data structure from said nonvolatile storage, decrypting said encrypted version of said first data structure (see column 6 lines 55-67) and a method for encrypting (see column 5 lines 41-67).

Art Unit: 2137

Sibert fails to disclose the encryption subroutine includes receiving a request to shut down said computing system, reading said first data structure from said computer readable medium, encrypting said first data structure to produce an encrypted version of said first data structure.

However, Tello teaches performing tasks at shut down (see column 14 lines 1-41).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to perform Sibert's method of encryption at shut down as taught by Tello.

Motivation to do so would have been to hide data storage devices (see Tello column 14 lines 1-41).

The modified Sibert and Tello system fails to disclose, as a part of the encryption method, deleting said first data structure from said computer readable medium, and storing said encrypted version of said first data structure in nonvolatile storage, starting at a second location within said nonvolatile storage, and, as a part of the decryption method, writing said data structure to said computer readable medium, starting at said first location.

However, Langford teaches such a replacement method (see column 4 line 63 through column 5 line 18).

Art Unit: 2137

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use Langford's method of overwriting in the modified Sibert and Tello system.

Motivation to do so would have been to allow no plaintext of the original data to be present (see Langford column 5 lines 1-18).

As per claims 2-3, the modified Sibert, Tello and Langford system discloses the second location is at the first location on the readable medium (see Langford column 4 line 63 through column 5 line 18).

As per claim 4, the modified Sibert, Tello and Langford system discloses the nonvolatile storage is a memory structure, separate from said computer readable medium, with said computing system (see Sibert column 6 lines 55-67).

As per claim 5, the modified Sibert, Tello and Langford system discloses encryption of said first data structure occurs within a cryptographic processor in said computing system using an encryption key, said cryptographic processor is separate from a system processor within said computing system, and decryption of said encrypted version of said first data structure occurs within said cryptographic processor in said computing system using a decryption key generated from data stored in secure storage accessed by said cryptographic processor (see Sibert

Art Unit: 2137

column 5 lines 49-56 and column 6 lines 61-67 where the "cryptographic circuitry" is the processor).

As per claim 6, the modified Sibert, Tello and Langford system discloses a public key of said computing system is used for encryption of said first data structure, and a private key of said computing system is used for decryption of said encrypted version of said first data structure (see Tello column 8 lines 34-40).

As per claim 7, the modified Sibert, Tello and Langford system discloses the encrypted version of said first data structure is equal in length to said first data structure (see Langford column 4 line 62 through column 5 line 18).

As per claims 11-12, the modified Sibert, Tello and Langford system discloses said method additionally comprises a configuration subroutine providing a user interface for setting and resetting a configuration bit, and said encryption subroutine is executed according to a state of said configuration bit and said encryption subroutine additionally includes setting a flag bit in non-volatile storage, and said decryption subroutine is executed only when said flag bit is set (see Tello column 14 lines 34-40 where it is inherent that a bit is set for encryption and decryption should only happen for encrypted data).

Art Unit: 2137

As per claims 13 and 19, the modified Sibert, Tello and Langford system discloses a method providing security for a plurality of data records stored on a computer readable medium within a computing system, wherein said computer medium additionally stores a first data structure starting at a first location within said removable computer readable medium, locating data records in said plurality thereof, said method comprises an encryption subroutine executed to encrypt said first data structure and a decryption subroutine subsequently executed to decrypt an encrypted version of said first data structure, said encryption subroutine includes reading said first data structure from said computer readable medium, encrypting said first data structure within a cryptographic processor in said computing system using an encryption key to produce an encrypted version of said first data structure, deleting said first data structure from said computer readable medium, and storing said encrypted version of said first data structure in nonvolatile storage, starting at a second location within said nonvolatile storage, and said decryption subroutine includes reading said encrypted version of said first data structure from said nonvolatile storage, decrypting said encrypted version of said first data structure within said cryptographic processor in said computing system using a

Art Unit: 2137

decryption key generated from data stored in secure storage accessed by said cryptographic processor to form said first data structure, and writing said data structure to said computer readable medium, starting at said first location (see rejection of claim 5).

Claims 14-16 and 20-22 are rejected as in claims 1, 11-12 respectively.

As per claims 17-18 and 23-24, the modified Sibert, Tello and Langford system discloses a cryptographic selection subroutine providing a graphical user interlace, said cryptographic selection subroutine includes displaying a choice between encryption and decryption, displaying representations of computer readable medium in said computing system, and receiving a cryptographic selection signal indicative of whether encryption or decryption is to occur and of a chosen computer readable medium, said encryption subroutine is executed in response to receiving cryptographic selection signal indicating encryption is to occur, with said first data structure of said chosen computer readable medium being encrypted, and said decryption subroutine is executed in response to receiving a cryptographic selection signal indicating decryption is to occur, and with said encrypted version of said first data structure of said chosen computer readable medium being

Art Unit: 2137

decrypted wherein said encrypted version of said first data structure is stored in nonvolatile storage on said chosen computer readable medium (see Langford column 6 lines 52-67 for the GUI and the encryption/decryption and hard drives as in Tello and Sibert applied to previous claims).

8. Claims 8-9 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over the modified Sibert, Tello and Langford system as applied to claims 1 and 19 above, and further in view of Robinson et al (U.S. 5,544,356).

As per claims 8-9 and 25, the modified Sibert, Tello and Langford system fails to disclose the computer readable medium additionally stores a second data structure, starting at a second location within said computer readable medium, describing characteristics of said first data structure, and said encryption subroutine additionally includes reading said second data structure to determine characteristics of said first data structure wherein said first data structure is a file allocation table, and said second data structure is a boot record.

However, Robinson et al teaches a boot record describing the file allocation table (see column 1 line 64 through column 2 line 4).

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use the modified

Art Unit: 2137

Sibert, Tello and Langford system to encrypt Robinson et al's file allocation table.

Motivation to do so would have been that the boot record includes the number of copies of the file allocation table (see Robinson et al column 1 line 64 through column 2 line 4).

9. Claims 8, 10 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over the modified Sibert, Tello and Langford system as applied to claims 1 and 19 above, and further in view of Starek et al (U.S. 6,070,174).

As per claims 8, 10 and 25, the modified Sibert, Tello and Langford system fails to disclose the computer readable medium additionally stores a second data structure, starting at a second location within said computer readable medium, describing characteristics of said first data structure, and said encryption subroutine additionally includes reading said second data structure to determine characteristics of said first data structure wherein said first data structure includes an array of file records in a master file table of a NTFS file, and said second data structure includes metafile data in said master file table.

However, Starek et al teaches such data structures (see column 10 lines 29-51).

Art Unit: 2137

At the time of the invention it would have been obvious to a person of ordinary skill in the art to use the modified Sibert, Tello and Langford system to encrypt Starek et al's file array.

Motivation to do so would have been that the metafile describe the file system structure (see column 10 lines 29-51).

10. Claims 1-25 are rejected as above but in view of JP2001202167A, which discloses a control method for a computer, involves encrypting and decoding data on memory based on power supply ON/OFF.

Conclusion

11. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Rollins (US 20020141588 A1) discloses a method for data security for digital data, Flyntz (US 6351817 B1) discloses encrypting the data on a hard drive at the end of a user session, Sherman et al (US 6249868 B1) discloses a method for securing data on a hard drive, Kong (US 5884026 A) discloses a method for protecting an operating system, Pereira (US 5809230 A) discloses encrypting

Application/Control Number: 09/919,240 Page 12

Art Unit: 2137

and rewriting a MBR to a disk, Cummins (US 5007082 A) discloses a data security method using an encryption/decryption algorithm which attaches at the primitive BIOS level of the operating system, and Allen et al (US 4757533 A) discloses a method for hard disc protection.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael Pyzocha whose telephone number is (571) 272-3875. The examiner can normally be reached on 7:00am - 4:30pm first Fridays of the bi-week off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Andrew Caldwell can be reached on (571) 272-3868. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
